

## Potato Disease classification

Farmers who grow potato are facing economic losses every year because of various diseases that can happen to a potato plant. There are two common diseases Early Blight and Late Blight. If a farmer can detect these diseases early and apply appropriate treatment then it can save lot of waste and prevent economic loss

## Potato Disease Classification

A deep learning project to predict potato plant disease has the potential to significantly benefit farmers and the agricultural industry. By early detection of diseases and reduced use of pesticides, the model can help farmers to increase crop yield and reduce economic losses.
